                                                          FUNCTION: SECRETOCRAIN I IS A NEUROENDOCRINE SECRETORY GRANULE PROTEIN, WHICH MAY BE THE PRECURSOR FOR OTHER BYOLOGICALLY ACTIVE PEPTIDES. THE 16 PAIRS OF BASIC AA DISTRIBUTED THROUGHOUT ITS SEQUENCE MAY BE USED AS PROTEOLYTIC CLEAVAGE SITES.
FUNCTION: SECRETOLYTIN HAS ANTIBACTERIAL ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       65 GAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGR-----ELRRMS 118

SUBMITTEG (FEB-1997) to the EMBL/GenBank/DDBJ databases.

-1- FUNCTION: VOLPAGE-SENSITIVE CALCIUM CHANNELS (VSCC) MEDIATE THE EMBLY OF CALCIUM TONS INTO EXCITABLE CELLS AND ARE ALSO INVOLVED

CONTRACTION: WOLFAGE-SENSITIVE CALCIUM CHANNELS. GENE EXPRESSION, CELL MOTILITY, CELL DIVISION AND CELL DEATH. THE ISOFORM ALPHA-1B GIVES RISE TO N-TYPE CALCIUM CURRENTS. N-TYPE CALCIUM CHANNELS

BELONG TO THE "HIGH-VOLTAGE ACTIVATED" (14VA) GROUP AND ARE BLOCKED BY OMEGA-AGATILA). THE MAN DEAT GOMEGA-AGATOXIN-1

IIIA (OMEGA-CONOTOXIN-GVIA (OMEGA-CTX-GVIA) AND BY OMEGA-AGATOXIN-1

IIIA (OMEGA-CONOTOXIN-GVIA) (OMEGA-CTX-GVIA) AND BY OMEGA-AGATOXIN-1

CALCIUM CHANNELS CONTAINING ALLPHA-1B SUBUNIT MAY PLAY A ROLE IN DIRECTED MIGRATION OF IMMATURE NEURONS.

CALCIUM CHANNELS CONTAINING ALLPHA-1B SUBUNIT MAY PLAY A ROLE IN DIRECTED MIGRATION OF IMMATURE NEURONS.

COMPLEXES, CONSISTING OF ALLPHA-1, ALPHA-1B SUBUNIT SUBUNIT SUBUNIT SUBUNIT SUBUNIT SUBUNIT SUBUNITY SUBCELLULAR LOCATION INTERRAL NERVORES ENERGY AND ALPHA-1B-1 AND ALPHA-1B-2 ARE EXPRESSED IN THE CENTRAL NERVOUS SYSTEM, BUT NOT IN SKELETAL MUSCUE ON ALPHA-1B-2 ARE PRODUCED BY ALTENANILES CONTAINS FIVE HYDROPHOBIC TRANSMEMBRANE SEGMENT (S4): S4 SEGMENTS

-1- TISSUE SPECIFICITY: ALPHA-1B-1 AND ALPHA-1B-2 ARE EXPRESSED IN THE POOMAIN: EACH OF THE FOUR INTERNAL (REVORMS AND ARE CHARACTERIZED BY SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION

-1- TOWAIN: PROSPHOBLY THE YOUTGE-SENSOR AND ARE CHARACTERIZED BY SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cheung A.K.;
Submitted (NOV-1989) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: THIS IE PROTEIN IS A MULTIFUNCTIONAL PROTEIN CAPABLE OF MIGRATING TO THE WILLEUS, BINDING TO DNA, TRANS-ACTIVATING OTHER VIRAL GENES, AND AUTOREGULATING ITS OWN SYNTHESIS.
-!- SUBCELBULAR LOCATION: NUCLEUS OF INFECTED CELLS.
-!- PTM: A LONG STRETCH OF SERINE RESIDUES MAY BE A MAJOR SITE OF PHOSPHORILATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           49 -SHQQEQPTSSSHHGGAGAV-EIRSRHSSYP-AGTEDDEGMGEEPS-PFRGRSRSAP 101

CHROMAFFIN CELLS AND NORADRENERGIC NEURONS BY ACTING AS A NON-
COMPETITIVE NICOTINIC CHOLINERGIC ANTAGONIST.
FUNCTION: VASOSTATIN-1 HAS ANTIBACTERIAL ACTIVITY AGAINST GRAM-
POSITIVE BACTERIA M.LUTEUS, B.MEGATERIUM. NOT ACTIVE AGAINST GRAM-
POSITIVE BACTERIA B.CEREUS, B.SUBTILIS, S.PYROGENES, M.FORTUITUM,
S.AUREUS AND L.MONOCYTOGENES AND AGAINST GRAM-NEGATIVE BACTERIA
E.COLI, E.CLOACAE, S.TYPHIMURIUM, K.PNEUMONIAE AND P.AURUGINOSA.
A.BRASSICOLA, N. HEMATOCOCCA, F. CULMORUM AND F. CXYPORUM AND
AGAINST S.CEREVIASE AND C.ALBICANS YEAST. INACTIVE AGAINST
                                                                                                                                                                       -!- FUNCTION: CHROMACIN HAS ANTIBACTERIAL ACTIVITY AGAINST MICROCOCCUS
              Bauer S.H., Zhang X.Y., Van Dongen W., Claeys M., Przybylski M.; "Chromogranin A from bovine adrenal medulla: molecular characterization of glycosylations, phosphorylations, and sequence heterogeneities by mass spectrometry."; hall blochem. 274:69-80(1999).
-1- FUNCTION: PANCREASTATIN STRONGLY INHIBITS GLUCOSE INDUCED INSULIN
                                                                                                                                     -1- FUNCTION: CHROMOSTATIN COMPLETELY INHIBITS CATECHOLAMINE RELEASE
                                                                                                                                                                                                                                                                                                                                                                                                                                               MASS SPECTROMETRY: MW-8584.9; METHOD-MALDI; RANGE-19-94.
MISCELLANEOUS: BINDS CALCIUM WITH A LOW-AFFINITY.
SIMILARITY: BELONGS TO THE CHROMOGRANIN / SECRETOGRANIN PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Signal; Amidation; Glycoprotein; Calcium-binding; Phosphorylation; Polymorphism; 3D-structure; Antibiotic; Fungicide.

J. Dent. Res. 76:754-760(1997).

-! FUNCTION: COULD BE INVOLVED IN THE INDUCTION OF MINERALIZATION OF

EXTRACELLULAR MATRIX AND IN DENTINOGENESIS.

-! TISSUE SPECIFICITY: EXPRESSED IN FETAL BRAIN, BONE AND TOOTH

PARTICULARIX IN ODONTOBLAST, BUT NOT IN AMELOBLAST. NOT EXPRESSED

IN LIVER AND SKIN.
                                                                                                                                                                                                                   63 GAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMSD--- 119

The present sequence is the human APOP-1 protein. This protein, which shares structural and chemical homology with Bcl-2, is involved in cell proliferation. Its coding sequence was isolated by screening a synovial tissue cDNA library using a computer search for amino acid sequence alignments. The gene and protein can be used in the treatment of various cancers, disorders with associated inflammation such as Addison's disease, adult respiratory distress syndrome, allergies, anaemia, asthma, atherosclerosis, Crohn's disease, ulcerative colitis, diabetes mellitus, emphysema, glomerulonephritis, gout, Graves' disease, irritable bowel syndrome, lupus erythematosus, multiphe sclerosis, myasthenia gravis, myocardial or pericardial inflammation, osteoporosis, rheumatoid arvitis, syndrome and autoimmune thyroiditis, complications of cancer, haemodialysis and extracorporeal circulation, infections trauma, disorders with associated apoptosis including AIDS and other frauma, disorders with associated apoptosis including AIDS and other curemer and generatic immunodeficiencies, meurodegenerative diseases can canchal infarction, and wasting diseases including cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BCI-XL/BCI-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; noctropic; antischemnic; vulnerary; cytostatic; antisiral antiarthritic; antisinal ammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunosuppressive; apostosis inducer; apoptosis inhibitor; cancer; immunosdeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arbritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.

for activity that promote cell survival or apoptosis. Other uses include inducing or inhibiting apoptosis in a cell. Candidate compounds identified and (mutant) BAD polypeptides are useful in treating immunodeficiency diseases, neurodegenerative diseases, ischaemic cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      death, reperfusion cell death, wound healing, cancer, viral infections, imporpolative conditions, arthrilis, infertility, inflammation and autoimmune diseases. The present sequence represents a specifically claimed human BAD mutant amino acid sequence from the present invention.
                                                                                                                                                                                                                      The present invention describes an isolated or synthetic polypeptide (I) comprising a less than full length amino acid sequence of a mutant Bcl-XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Serlis of a murine BAD (longer murine BAD) or Serlis of a murine BAD (shorter murine BAD). (I) has immunostimulant, neuroprotective, notariarchardic, antiischaemic, vulnerary, cytostatic, antiivral, antiarthritic, antiinflammatory and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and polymouleotides can be used for screening candidate compounds and drugs for activities that are accompanied to the compounds and drugs for activities that are accompounds and drugs for activities.
                                               New mutant Bcl-XL/Bcl-2 Associated Cell Death Regulator polypeptide, useful for screening for candidate compounds which induce or inhibit apoptosis, comprises amino acid substitutions at Ser118, Ser155 or
                                                                                                                                                                            Claim 1; Page 147; 157pp; English.

                                                                                                                                                                                                       The invention relates to methods of altering the polypeptide levels in a cell, using proteins selected from S-phase kinase associated proteins 1 and 2 (SKPL, SKP2), SKP2-like proteins (ZF) and CUL-1 (a member of the cullin, CDC53 family of proteins). The method is useful for altering the level of p27, cyclin E, Max, Mad, c-Myc, MDM2, p53, Bax, Bad or Bcl-2 polypeptide in a cell. SKP2 and SKP2-like protein levels are useful for detecting tumours, and in monitroring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for
                                                                                                    Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -

                                                                                                                                                                                                   3
                             The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BBC6 which regulates cell death through interaction with BC1-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and the rabea antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bcl-XL/Bcl-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; immunosuppressive; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.

The present invention describes an isolated or synthetic polypeptide (1) comprising a less than full length amino acid sequence of a mutant Bel-XL/Bel-2 associated cell death requiator polypeptide (BAD) or its fragment, which contains amino acid substitutions at Serl18 of a human BAD, Serl55 of a murine BAD (longer murine BAD) or Serl13 of a murine BAD, solotropic, antischaemic, vulnerary, cytostatic, antiviral, nootropic, antischaemic, vulnerary, cytostatic, antiviral, antiarthritic, antilnflammatory and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. BAD polypeptides and polynucleotides can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include indentified and (mutant) BAD polypeptides are useful in treating immunodeficiency diseases, neurodegenerative diseases, ischemic cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. The present sequence represents a specifically contained shorter murine BAD mutant amino acid sequence from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Epitope; murine; bcl-x(L)/bcl-2 associated death promoter; Bad; stroke; polypeptide; bcl-x; cell death; regulate; BH1; BH2; apoptotic cell death; cytokine deprivation; IL-3 dependent cell line; immunodeficiency; AIDS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMSDE 120

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence is the murine BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat corprevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, ciffammation and autoimmune disease. Polynuclectide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aping or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family serituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMSDE 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                               This sequence represents the murine bcl-x(L)/bcl-2 associated death correcter (Bad) gene. Bad is a 22.1 kD protein which interacts with bcl-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2 related family clustered in the BH1 and BH2 domain. Bad assays and in vivo in mammanian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L) and bcl-2 in yeast two-hybrid death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an II-3 dependent cell line expressing bcl-x(L), and its also counters the countering the death of bcl-x(L). Bad competes with Bax for binding to bcl-x(L). Bad may be used to identify agents which inhibit its binding to bcl-z(L) to form heterodimers. Such agents may be used to treat the prodegenerative diseases, immunodeficiency diseases,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a novel serine-phosphorylated protein, BAD (BAL-12 associated cell death regularch. The serine residue is phosporylated in a post-translational modification and allows binding to the 14-3-3 protein which is a signal transduction regulator. Addulators of phosphorylated BAD, which act through inhibition/activation of a phosphoserine phosphates, are useful for preventing/treating increased/decreased apoptosis in a cell. The increased apoptosis may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  result from immunodeficiency diseases, senescence, neurodegenerative disease, ischaemic cell death, reperfusion cell death, infertility and wound-healing. Decreased apoptosis may result from cancer, viral infection, lymphoproliferative conditions, arthritis, infertility, infilammation and autoimmune diseases. Measuring the amount of phosphorylated compared to unphosphorylated BAD polypeptide and/or total BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BC1-XL/BC1-2 associated cell death regulator; BAD; mutant; apoptosis; immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMSDE 120

The present invention describes an isolated or synthetic polypeptide

(I) comprising a less than full length amino acid sequence of a mutant

(I) comprising a less than full length amino acid sequence of a mutant

(I) comprising a less than full length amino acid sequence of a mutant

(I) associated cell death regulator polypeptide (BAD) or its

(I) for acid substitutions at Ser118 of a human

(I) has immunostimulant, neuroprotective,

(I) has immunostimulant, neuroprotective,

(I) notropic, antiinflammatory and immunosuppressive activities, and

(I) antiarthritic, antiinflammatory and immunosuppressive activities, and

(I) antiarthriting apoptosis in a cell. Candidate compounds

(I) immunodeficiency diseases, neurodegenerative diseases, ischaemic cell

(I) death, reperfusion cell death, wound healing, cancer, viral infections,

(I) immunodiferative conditions, arthritis, infertility, inflammation and

(I) autoimmune diseases. The present sequence represents a specifically
immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; Imphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMSDE 120

```
The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 aa sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologus polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, cancer, untant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease, Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, adjug or ischemmic cell death. The apoptotic status of cells is the content of the protein and non-content and n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14.3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14.3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              23;

```
death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, cancer, viral infection, lymphoproliferation, arthritis, infertility, cancer, viral infection, lymphoproliferation, arthritis, infertility, cancer, contained and autoinfamune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful.

In treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not beterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family Set: substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention describes mutant BAD (BCL-XL/BCL-2 associated cell

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 115 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infertility, infammation and autoimmune-disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is

phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.

Korsmeyer SJ;

WPI; 1998-261422/23. N-PSDB; AAV27838 New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection

Claim 8; Page 73; 95pp; English.

mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polynucleotide sequences encoding present invention describes mutant BAD (BCL-XL/BCL-2 associated cell The
